

**Investment objectives :**

In order to achieve the management objective over the recommended investment period >3 years , Keren Corporate adopts an active management style, investing in euro-denominated debt securities and money market instruments, private debt and convertible debt (max. 10%), with no a priori allocation constraints by geographic zone, duration, rating, business sector or security type.

**Change in net asset value:**

**Monthly review :**

In March 2026, the global economy was shaken by the war in Iran, triggering an energy shock. In Europe, growth was revised down to around 0.8–0.9%, while inflation rose again to approximately 2.5–2.6%. The European Central Bank suspended its rate-cutting cycle and is now considering further rate hikes. Increased stagflation risks and tensions in private debt markets led to a sharp sell-off in risky assets. Our defensive positioning and overlay strategies (contributing -0.04% and +0.31% respectively) performed exactly as intended. KC declined by 0.91% over the month, compared with losses of between 2% and 3% for euro corporate bond indices. It is also worth noting that high yield outperformed investment grade on a relative basis, despite outflows from the asset class.

**Performance analysis (Net of management fees)**

**Cumulative returns:**

	Fund	Benchmark	Spread

**Non-financial performances:**

This UCITS promotes environmental or social and governance (ESG) criteria within the meaning of Article SFDR of Regulation (EU) 2019/2088 on sustainability disclosures in the financial services industry (the 'SFDR Regulation'). It does not aim to be a sustainable investment. It may invest partially in assets with a sustainable objective, for example as defined by the EU classification.

**SFDR Indicators\*:**

**Quantitative analysis:**

Keren Finance's internal quantitative model is called KEYS (Keren ESG Yield System). It collects and stores extra-financial data from companies' ESG/ SRI or sustainability reports. It uses the Sequantis Transition Monitor tool, which retrieves data from Carbon4 Finance\* and Sustainalytics. This data is then compared against 13 or 25 criteria/Keys Performance Indicators (KPIs), by sector, using a best-in-class approach.

**Qualitative analysis:**

In addition to the quantitative analysis, we also carry out a qualitative analysis based on the same criteria in order to check the consistency of our KEYS model. As KEYS only collects data from extra-financial reports, some key information is sometimes not included because it is directly available on the issuer's website or in press reviews.

**Fossil Energy:**

Sector	Exposure
Charbon	2.40%
Pétrole	0.36%

## Glossary:

<b>Sharpe Ratio</b>	The Sharpe ratio is an indicator that measures the risk-adjusted return of an investment by comparing the excess return of an asset over a risk-free asset, relative to the volatility of that asset.
<b>Sortino Ratio</b>	The Sortino ratio is a risk-adjusted performance indicator that measures the excess return of an investment over a specific risk threshold, focusing solely on the negative volatility or 'bad volatility' of that investment.
<b>Max drawdown</b>	The maximum drawdown is the greatest percentage loss suffered by an investment or portfolio from its last peak to its lowest point, thus measuring the maximum risk taken over a given period.
<b>Benchmark Beta</b>	Beta measures how the fund's net asset values fluctuate relative to those of its benchmark index. A beta below 1 means that the fund is less volatile than its index, while a beta above 1 indicates higher volatility. A negative beta indicates an inverse reaction to fluctuations in the index.
<b>Tracking Error</b>	Tracking error is a measure of the divergence between a portfolio's returns and those of its benchmark index, indicating the relative performance gap between the portfolio and its index.
<b>VaR</b>	Value at Risk (VaR) refers to the estimate of the maximum probable loss that an investor could incur on the value of a portfolio of financial assets, taking into account a specific holding horizon (e.g. 20 days) and a given level of confidence (e.g. 99%). This estimate of potential loss is expressed as a percentage of the total value of the assets in the portfolio. It is calculated on the basis of a sample of historical data.
<b>Volatility</b>	Volatility is a measure of the amplitude of fluctuations in the prices or returns of a financial asset, indicating the level of risk associated with that asset.
<b>Investment Grade</b>	Investment Grade is a classification assigned to securities considered to be of high quality and presenting a low risk of default according to financial rating agencies.
<b>High Yield</b>	High yield, also known as 'non-investment grade' or 'junk bond', refers to debt securities issued by companies or entities whose creditworthiness is considered riskier by rating agencies. These bonds generally offer higher yields to compensate for the increased risk of default.
<b>Net Asset Value</b>	Price of a unit in a mutual fund
<b>Sensitivity</b>	The sensitivity of a bond refers to the reaction of its price to changes in interest rates. More precisely, it is the measure of the percentage change in the bond's price for a one percentage point change in interest rates. A higher sensitivity indicates a greater reaction to interest rate fluctuations. Sensitivity is closely related to duration, but is generally expressed as a percentage, providing a direct indication of the magnitude of the expected price change in response to a change in interest rates. The sensitivity shown in this document adjusts for the worst case scenario. The value shown is valid at the date of the document and may change during the life of the product.
<b>Duration</b>	The duration of a bond is a measure of the sensitivity of its price to changes in interest rates. It represents the weighted average duration of a bond's cash flows, including periodic coupons and repayment of principal at maturity. Duration is expressed in years and indicates the bond's relative sensitivity to changes in interest rates. The longer the duration, the more sensitive the bond is to changes in interest rates. The duration indicated in this document is adjusted to the worst-case scenario. The value shown is valid at the date of the document and may change during the life of the product.
<b>Yield</b>	The Yield To Maturity (YTM) of a bond represents the total annual rate of return that the investor would receive if he held the bond until its maturity date, taking into account the current price, the nominal value, the coupon payments and the remaining period to maturity. It is a measure of the overall return on investment over the life of the bond. The value displayed is valid on the date of the document and may change during the life of the product.
<b>Average maturity</b>	Average maturity weighted by the weight of the assets in the portfolio. Securities with no maturity date (or similar) are excluded from this calculation.
<b>Convertibles</b>	A convertible bond is a type of bond issued by a company that can be exchanged for a certain number of ordinary shares in the same company, at a predetermined price, during a defined period.
<b>KCR</b>	Internal credit rating system: Keren Credit Rating.
<b>Rating</b>	A rating from a rating agency is an evaluation of the financial solvency of a company, government or financial instrument, expressed as a letter, figure or qualitative term, which indicates the level of risk associated with that issuer or instrument.
<b>ESG</b>	Environmental, social and governance criteria.
<b>PAI</b>	(Principal Adverse Indicators) Describe significant or potentially significant negative impacts on sustainability aspects that result from, exacerbate or are directly linked to a legal entity's investment decisions or recommendations. Greenhouse gas (GHG) emissions and carbon footprint illustrate this phenomenon.

## COMMERCIAL CONTENT

Please refer to the KID and the prospectus for all investment decisions. For more information, please visit [www.kerenfinance.com](http://www.kerenfinance.com). Past performance is not a reliable indicator of future performance and is not constant over time.

## Keren Donation Fund and philanthropy:

In the interests of clarity, transparency and sharing, Keren Finance has chosen to link the annual payments made to the Keren Patronage fund to its turnover and not to its net income. Each time a client subscribes to a unit in a Keren Finance mutual fund, a percentage of the sales generated by the purchase is paid into the fund. The Mécénat Keren fund was set up within the Fonds de Dotation Transatlantique in 2016 to help research, the fight against cancer and, in particular, sick children.
